For Total, contributing to the development of a more responsible energy taking into account both environmental constraints and economic reality defines a new strategy of leadership based on low carbon solutions. Total R&D strategy is therefore twofold: on the one hand lowering carbon emissions, promoting gas et developing CCUS* technologies, on the other hand investing in renewable energies and storage.

Renewables have an essential role to play in the International Energy Agency's 2°C scenario. By 2035, the share of solar and other renewable energies in the global energy mix is expected to increase from 9% to 23%. For Total, renewable energies are part of the new paradigm of energy.
